

PACTA + TRISK

Transition-Risk Analytics for Vietnamese Banks

Agenda

- 1 The challenge: Decision 263 & transition risk
- 2 Our solution: a three-layer compliance stack
- 3 PACTA portfolio alignment
- 4 TRISK borrower stress testing
- 5 Vietnam-bank case study & live dashboard
- 6 Engagement offer, roadmap & next steps

Our Solution: A Three-Layer Compliance & Risk Stack

Layer	Capability	Output
Measure & Align	PCAF financed emissions	Scope 1/2/3 inventory
	PACTA vs PDP8 / NDC / NZE	Technology-share alignment gaps
Stress & Disclose	TRISK borrower stress	NPV & PD impact per borrower
	IFRS S2 / TCFD reporting	Board-ready disclosure pack
	Open-source R stack	No licensing fees

PACTA: Portfolio Alignment Assessment

Match the loanbook to asset-level company data and compare technology mix against Vietnam's targets.

Synthetic MCB portfolio: 43 loans, 25 trillion VND across power, automotive, cement, steel and coal mining.

Market-share method for power & automotive

SDA method for cement & steel intensity

Custom PDP8 scenario from Vietnam's PDP8

Company-level results enable borrower-specific engagement

Scenario comparison: PDP8 vs IEA NZE vs Vietnam NDC

Methodology used by 1,500+ institutions globally

Time to first results: 1–3 months

The Challenge: Decision 263 & Transition Risk

THE CHALLENGE

Decision 263/QD-TTg mandates GHG quotas for thermal power, steel and cement from 2025. Banks must assess borrower transition risk — but lack tools to quantify portfolio alignment or borrower-level financial stress under Paris-aligned scenarios.

WHAT BANKS NEED

An integrated analytics stack that measures portfolio alignment with PDP8/NDC targets, quantifies borrower NPV and PD impact under transition scenarios, and produces disclosure-ready outputs for IFRS S2 and TCFD.

TRISK: Borrower-Level Transition Stress Testing

Quantify each borrower's NPV and PD impact under transition scenarios using DCF and Merton-based credit models.

Power: coal-heavy borrowers –12% to –18% NPV

Cement: BF/BOF mills –8% to –14% NPV

Steel: EAF routes outperform BF/BOF by 6–10pp

Priority ranking: alignment gap + NPV + exposure

Covers all three Decision 263 sectors

Scenario Builder drives five TRISK levers live

Open-source R package (trisk.model)

Phase 1 Data intake & loanbook normalisation (BYOL)

Phase 2 PACTA portfolio alignment on real borrower data

Phase 3 TRISK stress testing & borrower ranking

Phase 4 IFRS S2 disclosure pack & board-ready report

Timeline: 6–9 months from data receipt to final deliverables. All analytics are open-source with no licensing fees. We welcome the opportunity to discuss how this stack supports your transition-risk management and Decision 263 compliance.

Allotrope VC | Greening the Banks Vietnam

Case Study: Vietnam-Bank Demo — Power Sector Alignment

Portfolio	43 loans · 25 tn VND (synthetic)
Sectors	Power, cement, steel
Power mix	Coal 28% · Gas 12% · Hydro 10%
	Solar 8% · Wind 5%
PDP8 target	Coal phase-down; renewables 3× by 2030
Alignment gap	Coal +28% above; renewables –15% below
Method	PACTA market-share (power)
Scenarios	PDP8 · Vietnam NDC · IEA NZE
Output	Company-level alignment results
Data	Illustrative / synthetic

Case Study: TRISK Borrower Stress Rankings

TRISK ranks borrowers by financial stress under transition scenarios. Coal-heavy names (Vinh Tan, Duyen Hai, Mong Duong) show the steepest NPV decline and PD increase; renewable-focused borrowers (Trung Nam, BIM) gain transition tailwinds.

Illustrative / synthetic data — not actual portfolio results.

Priority score — top 10 borrowers

PD change by borrower

Case Study: Key Findings & Takeaways

Coal Stranded Risk

28% of portfolio coal capacity exceeds the PDP8 phase-down trajectory; BOT plants face a cliff after PPA expiry (~2035).

Renewables Gap

Renewables buildout is 15% below the 2030 target — solar and wind must roughly triple to align with PDP8.

Borrower Heterogeneity

NPV impact spans -18% (coal-heavy) to +8% (renewable-focused). Borrower-level data is essential.

Decision 263 Readiness

The PCAF → PACTA → TRISK stack covers all Decision 263 requirements: inventory, quotas and reduction plans.

Interactive Exploration

A live dashboard with Scenario Builder lets bank teams explore levers in real time, with HTML and CSV exports.

Power: Coal Capacity Trajectory

MCB portfolio coal exposure vs PDP8 ceiling & NZE phase-down
(BOT plants locked to contracts; legal constraint noted)

Cement: Emission Intensity Trajectory

ICO2/tonne | VICEM + Holcim Vietnam | PDP8/NDC conditional target: 0.71 by 2030
(IEA NZE target 0.54 requires CCS - not yet available in Vietnam)

Steel: Emission Intensity Trajectory

ICO2/tonne | Hoa Phat (BF/BOF, 1.85) vs Pomina (EAF, 0.58)
PDP8/NDC target: 1.50 by 2030 | Hoa Phat transition requires plant replacement (2040+)

Live Dashboard: Portfolio Analytics at a Glance

MCB Portfolio: PACTA Coverage

Total: 25,020 bn VND | Mekong Commercial Bank 2025

(In Scope) Matched

Coverage & alignment

MCB Portfolio: Alignment Gap at 2030 vs PDP8/NDC

Technology share gap: Projected miss Target (percentage points)
Positive = above target (good for low-carbon); Negative = below target

Borrower NPV impact
